Click 4-PS3-1 to view details for this Performance Expectation

**4-PS3-1 Energy**
Use evidence to construct an explanation relating the speed of an object to the energy of that object.
Performance Expectation | Grade: 3-5, 4

**4-PS3-2 Energy**
Make observations to provide evidence that energy can be transferred from place to place by sound, light, heat, and electric currents.
Performance Expectation | Grade: 3-5, 4

https://www.nextgenscience.org/search-standards?keys=&tid%5B%5D=104
**Disciplinary Core Ideas**

4-PS3-1: Use evidence to construct an explanation relating the speed of an object to the energy of that object. (Assessment Boundary: Assessment does not include quantitative measures of changes in the speed of an object or on any precise or quantitative definition of energy.)

- Ocean Core State Standards Connections: ELA/Literacy:
  - RI.4.3: Explain events, procedures, or concepts or ideas in a historical, scientific, or technical text, including what happened and why, based on specific information in the text.
  - RI.4.9: Integrate information from two texts on the same topic in order to write or speak about the subject knowledgeably.
- W.4.2: Write informative/explanatory texts to examine a topic and convey ideas and information clearly.
- W.4.8: Recall relevant information from experiences or gather relevant information from various sources.
- W.4.9: Draw evidence from literary or informational texts to support analysis, reflection, and research.

*The performance expectations marked with an asterisk integrate traditional science content with engineering through a Practice or Disciplinary Core Idea.*

## Evidence Statements

- **Guide Lesson Development**
- **Specifics - Details**
- **What Students are Doing**

### 4-PS3-1 Energy

**Students who demonstrate understanding can:**

Use evidence to construct an explanation relating the speed of an object to the energy of that object. **[Assessment Boundary: Assessment does not include quantitative measures of changes in the speed of an object or on any precise or quantitative definition of energy.]

### Science and Engineering Practices

- **Constructing Explanations and Designing Solutions**
  - Constructing explanations and designing solutions in 1-5 builds on K-2 experiences and progressions in the use of evidence in constructing explanations that specify variables that describe and predict phenomena and in designing multiple solutions to design problems.
  - Use evidence (e.g., measurements, observations, patterns) to construct an explanation.

### Disciplinary Core Ideas

- **PS2.A: Definitions of Energy**
  - The faster a given object is moving, the more energy it possesses.

### Crosscutting Concepts

- **Energy and Matter**
  - Energy can be transferred in various ways and between objects.

### Observable features of the student performance by the end of the grade:

1. **Articulating the explanation of phenomena**
   - a. Students articulate a statement that relates the given phenomenon to a scientific idea, including that the speed of a given object is related to the energy of the object (e.g., the faster an object is moving, the more energy it possesses).
   - b. Students use the evidence and reasoning to construct an explanation for the phenomenon.

2. **Evidence**
   - a. Students identify and describe the relevant evidence for the explanation, including:
     - i. The relative speed of the object (e.g., faster vs. slower objects).
     - ii. Qualitative indicators of the amount of energy of the object, as determined by a transfer of energy from that object (e.g., more or less sound produced in a collision, more or less heat produced when objects rub together, relative speed of a ball that was stationary following a collision with a moving object more or less distance a stationary object is moved).

3. **Reasoning**
   - a. Students use reasoning to connect the evidence to support an explanation for the phenomenon. In the explanation, students describe a chain of reasoning that includes:
     - i. Motion can indicate the energy of an object.
     - ii. The faster a given object is moving, the more observable impact it can have on another object (e.g., a fast-moving ball striking something (a gong, a wall) makes more noise than does the same ball moving slowly and striking the same thing).
     - iii. The observable impact of a moving object interacting with its surroundings reflects how much energy was able to be transmitted between objects and therefore relates to the energy of the moving object.
     - iv. Because faster objects have a larger impact on their surroundings than objects moving more slowly, they have more energy due to motion (e.g., a fast-moving ball striking a gong makes more noise than a slow-moving ball doing the same thing because it has more mass and is moving faster). (Note: This refers only to relative bulk motion energy and not potential energy, to remain within the DCL.)
     - v. Therefore, the speed of an object is related to the energy of the object.
